ULTRASOUND GROUP

Guy's and St Thomas'  
NHS Foundation Trust

# How to perform IUS in IBD and what to look for?

Federica Furfaro  
Gastroenterology and digestive endoscopy  
IRCCS San Raffaele Hospital  
Milan, Italy

# Thank you for the images/cine loops/slides:

- Gianni Maconi
- Frauke Petersen
- Katharina Mitrova
- Matina-Lydia Chatzinikolaou
- Christian Maaser

international bowel  
**ULTRASOUND GROUP**

# Outline

- Preparation
- Orientation and scan planes
- What to look for
- Examination technique

## Preparation (sonographer)

- Know the indication, clinical setting and history of patient
- Previous imaging? ( CT, MRI, endoscopy)
- Previous ultrasound images, on which machine?
- Patient identification, worklist
- Hygiene ( hands, probes with special wipes, even room in some circumstances), cover the probes in special circumstances
- Choice of the probe/ adequate preset on the machine

## Prepare the machine and yourself

- Clean probe (NO alcoholic solutions)
- On the right side of the patient
- Cord does not belong on the floor or around your neck
- Probe in right hand
- Left hand on buttons

# Tricks

- Your right hand is to use the probe , to touch the patient and the gel
- Your left hand is to steer the machine
- Don't switch
- Don't contaminate the control panel with gel ( from the patient's surface)
- The control panel is designed ergonomically for your left hand

# Preparation (patient)

## Fasting

- not necessary
- >4 h → reduce amount of food and air in the small bowel
- >6 h → recommended before assessing splanchnic blood flow and GI motility

## Prepare the machine – Insert patient's details

- Check patient ID / details
- Save examination when you finish

# Ultrasound machine

Monitor

Touchscreen

Probes

Control panel

Gel

# Ultrasound probes

PHASED ARRAY

LINEAR

CURVILINEAR

## ULTRASOUND PROBE TYPES

Frequency

# Properties of the different probes

**Low frequency:** 1-6 MHz, overview, more depth, less resolution

curved array for a larger field, detection of pathology

## RECOMMENDATIONS:

1. For a complete examination of the bowel both a low and high resolution probe are needed, LoE 5, GoR C, Strong consensus 13/13
2. A probe with a frequency above 5 MHz should be used when measuring wall thickness, LoE 4, GoR B, Strong consensus 13/13

*Nylund K et al. EFSUMB Recommendations and Guidelines for Gastrointestinal Ultrasound, Ultraschall Med 2017*

**High frequency:** > 5MHz (5-10 MHz), only surface accessible (8-10 cm depth penetration), high resolution, detailed examination  
(discrimination of stratification of the bowel wall)

# Preparation of image

Object in the centre  
Depth adjusted  
Focus in the good position  
Color scale  
Color gain

# Technical requirements

- Ultrasound machine with B-mode and Doppler mode
- Possibility to register video loops, digital documentation
- At least two probes
  - curved array 1-5 mHz or microconvex 4-8 mHz
  - linear array 5-10 mHz
- Optional CEUS / Elastography

# Ultrasound technique

# Prepare the patient

# Do it right from the beginning

- Expose abdominal area adequately
- Water-based ultrasound gel
- Hold the probe correctly

# Ultrasound technique

**All portions** of the bowel are scanned in long and short axes, and images are simultaneously captured to ensure **a continuous assessment**

# Scan planes

Imaging

Intestinal ultrasound

# Scan plans

**Longitudinal**

**Cross-section**

# Probe orientation

# Turning the probe

Keep your region of interest in the center

Keep your region of interest in the center

Keep your region of interest in the center

# What to look for

- What am I looking at – recognizing the different parts of the bowel and surrounding structures
  - Landmarks!!
- Normal vs. abnormal bowel wall
- What parameters do I need to look for?

# Anatomical landmarks in the left lower quadrant – Finding the Sigmoid

Sonografie spezielle Darmsonographie

WL: 127 WW: 256 [D]

14.11.2023 15:08:06

# Anatomical landmarks in the **mid upper abdomen** – Finding the **Transverse**

## Anatomical landmarks in the **right lower quadrant** – Finding the **TI**

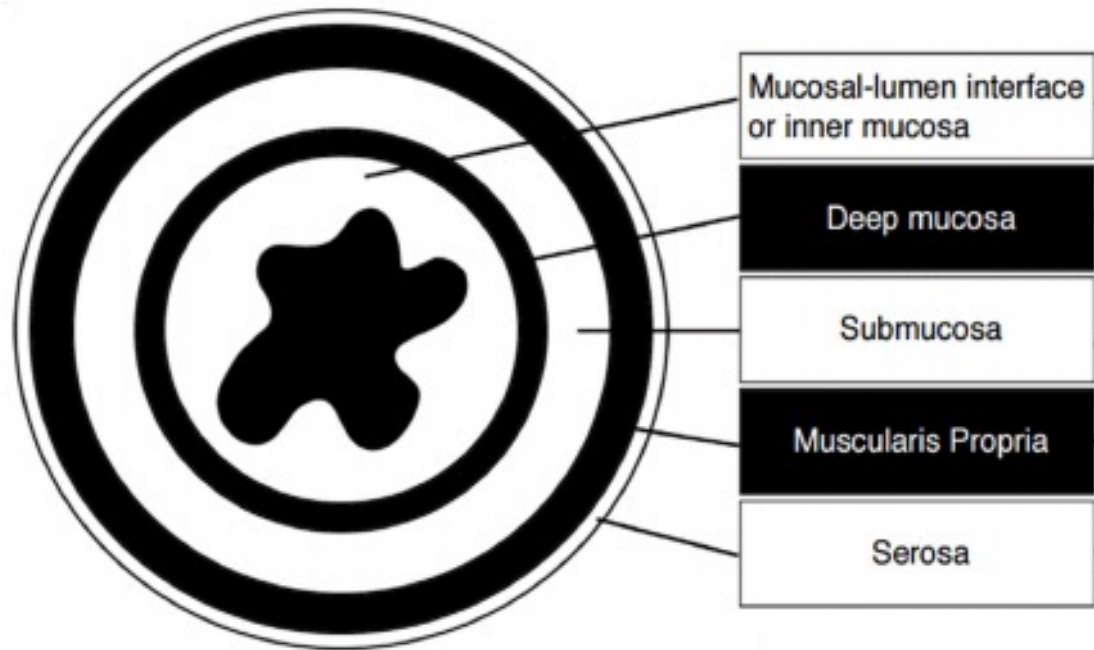

# Why are landmarks important?

- to make sure the orientation of the probe is correct
- to optimize the settings of the machine
- to find the correct bowel segment
- to re-orientate if lost

# Normal bowel wall

- 5 distinct sonographic layers

# Normal bowel wall in ultrasonography

## Some practical points:

- Interface echo of serosa mixed in with interface from peritoneum
- Posterior bowel wall often not possible to see due to air in the lumen → **Measurements in anterior wall!**
- Measure from mucosal hypoechoic layer to muscularis hypoechoic layer
- Avoid measuring at points of haustrations and mucosal folds (overestimation!)
- Careful: Do NOT compress too much! → **Graded compression**
- Keep probe perpendicular to GI wall

# Bowel wall thickness (BWT)

\*Measure at right angles to bowel wall layers.

Cut-off	Sensitivity	Specificity
3 mm	88%	93%
4 mm	75%	97%

# Bowel wall stratification

# Vascularisation – Colour Doppler

0 – No signal

Modified Limberg score

1 – minimal pixels,  
scant

2 – increased colour signal  
limited to the wall

3 – signal is significant in the wall  
as well as the mesentery

# Motility - Small bowel vs. colon

# Lumen

- Small bowel → Normal maximum diameter: **2 – 2.5 cm**

# Lumen

- Large bowel → Normal diameter: **up to 5 cm**  
(the cecum may exceed this width)

# Extraluminal

# Rectum

# Sigmoid Colon

# Descending colon

# Transverse colon

# Ascending colon

## Terminal ileum

# Appendix

- Highly variable position

# Appendix

- Highly variable position
- Graded compression
- <6 mm
- Readily compressible
- Mural stratification

# How to perform intestinal ultrasound

- Small bowel

*“mowing the lawn” technique*

# Limitations in bowel segments examination

Optimal bowel segments	Limited bowel segments
Sigmoid colon	Rectum
Descending colon	Splenic flexure
Transverse colon	Proximal ileum
Ascending colon	Jejunum
Ileocecal valve	
Terminal ileum	

# Take home messages

- Preparation: none
- Probe 5-8 MHz
- orientation
- know what to look for
- anatomical landmarks
- ultrasound scan plans
- systematic approach

## Untrained sonographer

## Anatomic location

## Obesity

*“But the starting point is awareness of the limits..”*

Thank you  
for your attention
