

Guide to setting up the machine

Kayal Vizhi Nagarajan

Consultant Gastroenterologist,
Aster CMI Hospital,
Bangalore, India

Kuwait City, Kuwait, November 21st – 22nd, 2025

Intended Learning Outcomes

By the end of this session, the learner will be able to:

1. Recall the piezoelectric principle and its role in ultrasound transduction, including the generation and reception of sound waves in medical imaging applications.
2. Describe the relationship between ultrasound frequency and its impact on resolution and depth of penetration in imaging various anatomical structures.
3. Describe and define key ultrasound principles, including:
 - Frequency
 - Depth
 - Gain
 - Resolution
 - Doppler
4. Classify the advanced principles of Doppler imaging and differentiate between their use in intestinal ultrasound (IUS).
5. Understand the concept of amplitude and acoustic tissue properties (e.g., impedance, absorption, reflection, elasticity) in ultrasound imaging and explain their significance in interpreting tissue characteristics, density variations, and artefacts.
6. Identify common ultrasound artifacts and their potential impact on image interpretation.
7. Explain how patient body habitus, bowel gas, and operator experience can affect IUS image quality.
8. Explain how to use ultrasound machine controls proficiently to optimize image quality during IUS examinations.
9. Describe the scenarios where IUS might be less reliable and require complementary imaging.
10. Discuss the impact of IUS limitations on its clinical utility compared to other imaging modalities in the IBD diagnostic pathway.

Disclosure

No specific disclosures

Intestinal ultrasound... is the machine different?

The same ultrasound equipment available in the radiology department

Machine quality

Machine Quality

- High end to mid-range machine (not point of care)
- Machine settings optimized for intestinal ultrasound
- Grey scale and Tissue harmonics are set for intestinal scanning

Know your machine representative

Piezo-electric effect of ultrasound

1 Piezoelectric Crystal
Emits Ultrasound Waves

2 Ultrasound Wave
Returns from Organ

3 Creation of Ultrasound
Image on Screen

Frequency: Resolution and penetration

Machine requirements - Probes

- **Curved array 3-5 mHz**
 - Low frequency = Deeper penetration but low resolution
 - General overview, detection and extension of pathology
- **Linear array 5-12mHz**
 - High frequency = Shallow penetration but higher resolution
 - Measurement of BWT, stratification of wall layers

Low frequency probe

High frequency probe

Environment Requirements

- **Room lighting**
 - Dim where possible
- **Machine position**
 - Left of patient. **Right hand** for scanning, **Left hand** for machine
- **Patient position**
 - Supine, relaxed, legs uncrossed, supported knees
- **Your position**
 - Neutral shoulders
 - Sitting or standing
 - Adjust bed height accordingly
- **Gel warmer**
- **Machine and hand hygiene**

Understanding the test

- **Doctor**

- Indication
- Patient disease phenotype, current therapies, past surgeries

- **Patient**

- Transabdominal, non-invasive
- Intestinal scan only
- Verbal Consent
- Preparation – No fasting.
- Full bladder useful for rectal views, may hinder TI views.

Image optimisation

- Ensure adequate gel and probe pressure on abdominal wall
- Gel is a coupling medium that allows the transmission of the acoustic waves and eliminates interference from the air

Knobology... No rocket science!

Modes on USG

- A mode
- M Mode
- **B mode**
- **Colour doppler**
- Power doppler
- Duplex imaging

B-mode

Doppler mode

Presence, direction and speed of flow in a vessel

Image optimisation – B Mode

So many buttons! Need to know:

1. Depth dial
2. Gain dial
3. Focus wheel (if not automatic)
4. Freeze image
5. Trackball
6. Store button for still image
7. Store button for cine loops
8. Calipers, image labelling/keyboard

Image optimisation: Depth

Image optimisation - Gain

Too high

Too low

Just right

Image optimisation – Focus

Image optimisation – Colour Doppler

- Optimize the colour Doppler for bowel wall interrogation
- **2-7cm/s optimal**
- **Reduce velocity to the lowest point where a signal is detected but noise is eliminated**
- Optimise the gain (brightness)

Too bright

Optimal

Freeze

Freeze image on screen

Use trackball to find best

Understand cine loop
storage settings

Image interrogation – Calipers

- Bowel wall thickness
- Length of stricture
- Luminal diameter

Optimal images

Depth
Gain
Focus

Anything Missing ?

Image labelling

Segment labelling

Terminal Ileum 2.2mm

Precision+ A Pure+
MI (1.3)
i18LX5
d15
29 fps
Qscan
G:92
DR:70
A:2
P:4

Body position marker

Probe orientation marker

ascending Colon 0.6mm

Precision+ A Pure+
MI (1.3)
i18LX5
d15
31 fps
Qscan
G:92
DR:70
A:2
P:4

Optimal images

In conclusion....

- Know your machine, probes and clinical information
- Look after yourself
- **Take some great pictures:**
 - Optimise depth, gain, focus
 - Freeze
 - Use trackball to choose best frame
 - Label image with words/body marker
 - Measure with calipers
 - Store image and/or cine loop
 - When using colour Doppler – optimise velocity and gain

Use your camera (IUS) to
see the intestines better!
